Modelled Natural CO₂ Sinks

Regional Trends in C-sinks and Annual Global Budget

- ✓ Global Annual Budget
- ✓ Regional Trends in Land C-Sinks (Trendy)
- ✓ Compare DGVM-based estimates with other evidence
 - Satellite derived data
 - Fluxtower data
 - Atmospheric Monitoring Stations

Trendy Protocol

GCP- Land trends: modelling protocol

Contact: Stephen Sitch (s.sitch@leeds.ac.uk) & Pierre Friedlingstein (p.friedlingstein@exeter.ac.uk) <http://dgvm.ceh.ac.uk>

Goal: To investigate the trends in NEE over the period 1980-2009

Participating models

JULES, LPJ, LPJ-GUESS, O-CN, Orchidee, HyLand, SDGVM,
NCAR-CLM4,
GFDL/Princeton, VEGAS

Model simulations

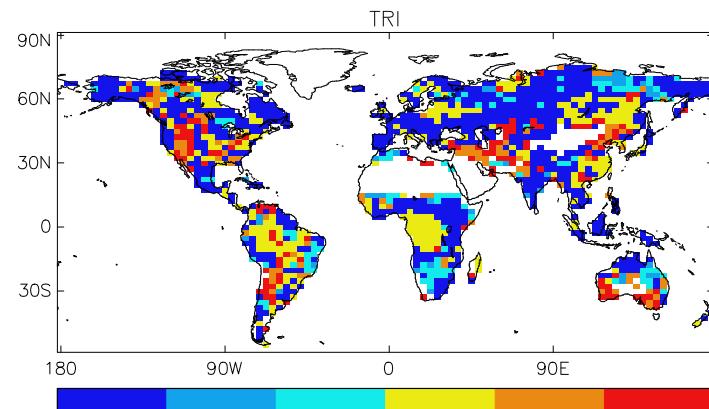

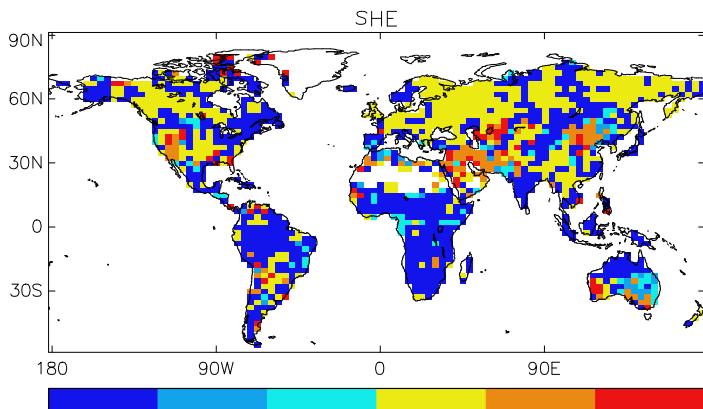

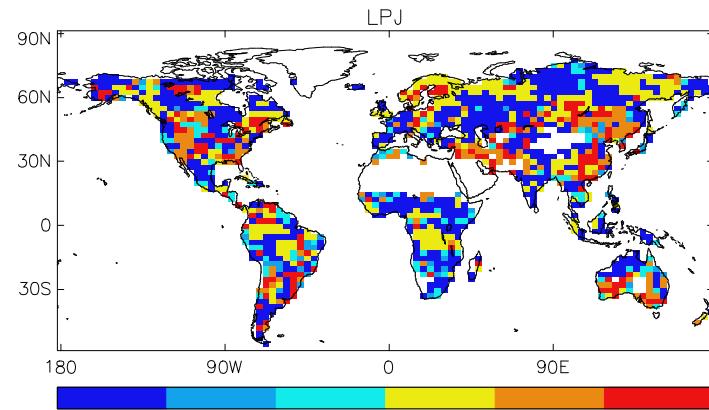

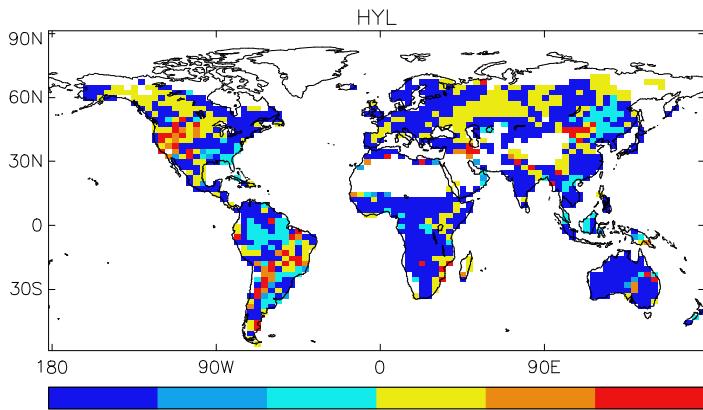

The models were forced over the 1901-2009 period with changing CO₂, climate (CRU/NCEP) and land use:

S1: CO₂ only

S2: CO₂ and climate

S3 (optional): CO₂, climate and land use

Trends in Land Processes

Land Sink trend

positive NPP trend > positive RESP trend
negative NPP trend > negative RESP trend
positive NPP trend, negative RESP trend

Alternative Upscaling Approaches

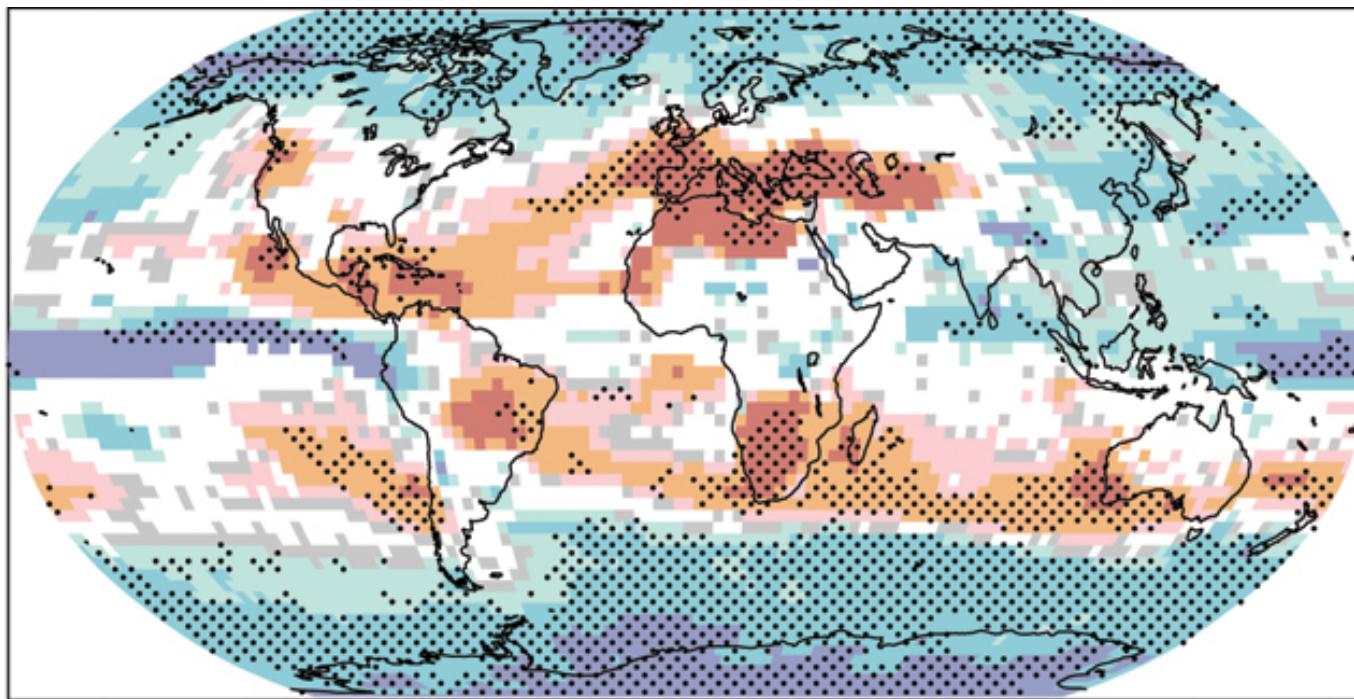

Multidimensional flux patterns...

... models to be cross-evaluated against.

Future Precipitation Changes (Summer Droughts?)

JJA

<http://www.ipcc.ch/>

Stippled areas > 90% of the models agree in the sign of the change

Summary

- Use set-up to produce global/regional annual C-budgets
- Drought may be an important driver of the present-day trends in the land carbon cycle
- Climate Models Project Summer Drought in Continental Regions
- Drought may be an important driver of the future trends in the land carbon cycle
- Critical to understand Ecosystem Response to Drought for future Earth System feedbacks
